

Specification Version 2.0(beta)

**NeoLAB Convergence Inc.** 

# Revision History

Ver	Date	Contents
2.0.0b	04-Oct, 18	New document
2.0.0b	18-Oct, 18	Corrected the wrong informations.
2.0.0.b	24-Oct, 18	Added about Datalogics PDF sample

## **Contents**

- 1. About this document
- 2. Base concept to Know before getting started
- 3. Preface
- 4. How it works
- 5. Dependency
- 6. Class summary
- 7. How to use Ncode sample application
- 8. Caution
- 9. Generating Ncoded PDF sample with PDF library

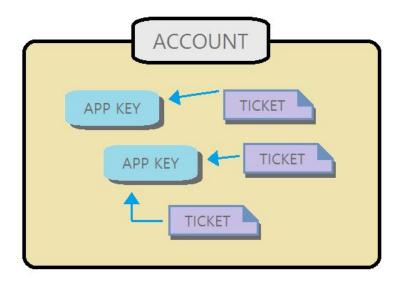

# 1. About this document

This document is for programming user. This document explains Ncode functions and how to use sample source code.

# 2. Base concept to Know before getting started

### 1) Simple process of NeoLAB cloud API service

- 1-1) Create account
- 1-2) Buy tickets
- 1-3) Create app key
- 1-4) Exercise sample app
- 1-5) Test your app key and tickets

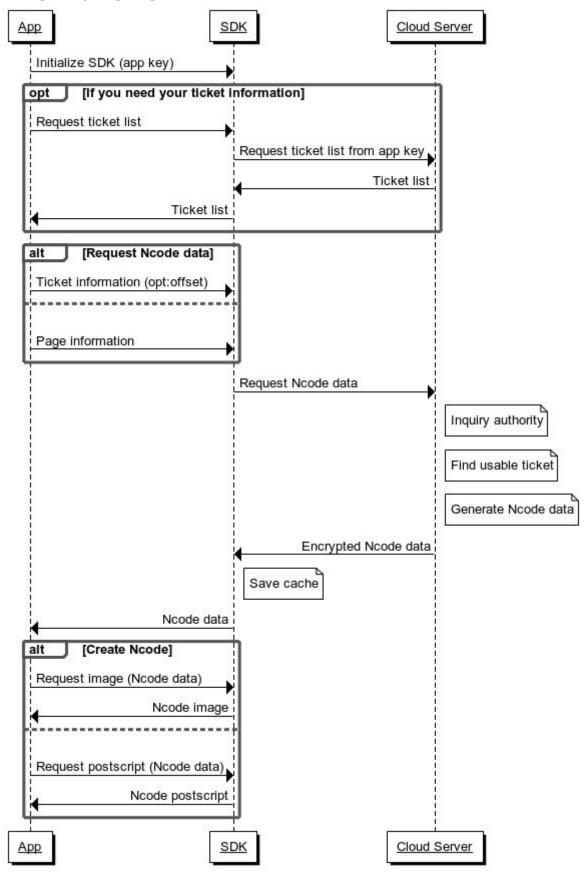

## 2) Important keywords

- Ncode NeoLAB convergence short line and dot code
- Account Account has tickets and app keys
- Ticket A type of certificates that have a range of purchased Ncode
- App key Unique identification code for requesting Ncode in application.
- section, owner, book, page The element that makes up the Ncode page.

# 3. Preface

Please prepare C# development environment. We recommend Microsoft Visual Studio series.

# 4. How it works

# 5. Dependency

NeoLABNcodeSDK.dll Newtonsoft.Json.dll

# 6. Class summary

### CNcodeSDK class

This class contains everything about the Ncode SDK's overall processing. Inquiring tickets, Ncode generating and other utility functions.

bool Init(	Initialize with app key
string appKey,	Parameters :
string workingFolder = "",	appKey - application key
string cacheFolder = "")	workingFolder - the folder in which to store the Ncode
,	image or Ncode postscript file
	cacheFolder - the folder in which to store the cache
	Returns :
	Success > true
	Failure > false > 370 : Folder setting error
List <ticketinfo> GetTickets()</ticketinfo>	Return ticket list from account of app key
<b>(</b>	Returns :
	Success > TicketInfo list
	Failure > null > Cannot find app ID
	Failure > null > 340 : Initialize with app secret key first.
TicketInfo	Sets the page information to be made based on the
SetStartPageFromTicket( TicketInfo ticket,	selected ticket
int ownerOffset,	Parameters :
int bookOffset,	ticket - base ticket
int pageOffset)	ownerOffset - offset owner value from base value
	bookOffset - offset book value from base value
	pageOffset - offset page value from base value
	Returns :
	Success > Result TicketInfo applied with offset value
	Failure> null > 350 : Ncode page information is out of your ticket.(owner)
	Failure > null > 351 : Ncode page information is out of your ticket.(book)
	Failure> null > 352 : Ncode page information is out of your
	ticket.(page) Failure> null > 353 : Ncode page information is out of
	range.

#### Size GetInchValueFromPaperSize(

String paper,

bool isLandscape = false)

Get paper inch size(width, height) from paper name.

 $A0 \sim A10$ ,

B0 ~ B10.

C0 ~ C10,

STMT, A, B, C, D, E,

ELEPHANT, MEDIUM, ROYAL, POST,

CROWN, LARGE POST, DEMY, DOUBLE DEMY, QUAD

DEMY,

QUATRO, EXECUTIVE, GOVERNMENT-LETTER, LETTER,

FOOLSCAP, LEGAL, LEDGER, TABLOID

#### Parameters:

Paper - paper size name

isLandscape - if value is true, landscape shape. else

portrait

#### Returns:

Success > Calculated page width and height inch value Failure > zero size (0, 0) > 360: Cannot find paper name

Request Ncode data.

#### int

#### GenerateNcode(

out List<NcodePage> pages, TicketInfo startPageInfo, int width, int height, int pageCount)

#### Parameters:

pages - NcodePage class list receive data startPageInfo - first page information to create Ncode data width - width of Ncode data to create in inch height - height of Ncode data to create in inch pageCount - the page count to generate

#### Returns:

Success > 0

Failure > 340 > Initialize with app secret key first.

Failure > 404 > Cannot find app ID

Failure > 801 > Generating Ncode failed

Failure > 802 > Code type is wrong

int	Request Ncode data.
GenerateNcode(	
out List <ncodepage> pages,</ncodepage>	Parameters :
NCODE_TYPE ncodeType,	pages - NcodePage class list receive data
int section,	ncodeType - Ncode type(one of N3C6, G3C6, S1C6, P1C6)
int owner,	section - section number to create
int book,	owner - owner number to create
int page,	book - book number to create
int width,	page - page number to create
int height,	width - width of Ncode data to create in inch
int pageCount)	height - height of Ncode data to create in inch
,	pageCount - the page count to generate
	Returns :
	Success > 0
	Failure > 340 > Initialize with app secret key first.
	Failure > 404 > Cannot find app ID
	Failure > 801 > Generating Ncode failed
	Failure > 802 > Code type is wrong
int	,,
GetImage(	Make Ncode image file from data.
<u> </u>	Parameters:
NcodePage page,	
int dpi,	page - page to make image
string filename,	dpi - dpi of image file (600 or 1200)
bool isBold)	filename - image file name
	isBold - bold code option(N3C6)
	Returns:
	Success > 0
	Failure > 380 > Error occurred while making image.
•	Failure > 381 > DPI must be 600 or 1200.
int	Make Ncode postscript file from data.
GetPostscript(	Temporarily support only S1C6 and P1C6.
List <ncodepage> pages,</ncodepage>	
string filename,	Parameters:
double dotScale = 1.0)	pages - pages to make postscript
	filename - postscript file name
	dotScale - dot size(0.8~2.0)
	Returns:
	Success > 0
	Failure > 341 > DotScale must be in 0.8 ~ 2.0
	Failure > 342 > (postscript error stack trace)
	Failure > 343 > Data type error
string	Get last error message, if an error occurs.
GetLastError()	
	Returns :
	Error message string

string GetVersion()	Get current version of Ncode SDK.  Returns: Current version of SDK string
class Ticketinfo definition	<pre>public class TicketInfo {     public NCODE_TYPE ncodeType;     public int section;     public int ownerStart;     public int ownerSize;     public int bookSize;     public int bookStart;     public int pageStart;     public int pageSize;     public int period;     public string extraInfo; }</pre>
class NcodePage definition	public class NcodePage {     public NCODE_TYPE ncodeType;     public int section;     public int owner;     public int book;     public int page;     public double width;     public double height;     public string data; }

# 7. Sample application processing

### 1) Declare Ncode SDK class.

```
CNcodeSDK sdk = new CNcodeSDK();
```

### 2) Initialize with app key.

```
sdk.Init("juyhgt54redfv7ujmnhgt5esq0poli");
```

### 3) Get tickets from pre-set app key.(optional)

```
List<TicketInfo> tickets = sdk.GetTickets();
```

## 4) Set the start page information.(optional)

# 5) Set the page size.(optional)

```
SizeF pageSize = sdk.GetInchValueFromPaperName("A4", false);
```

#### 6-a) Request Ncode data

```
sdk.GenerateNcode(
   out codeData,
    startPageInfo,
   pageSize.Width, // inch
   pageSize.Height, // inch
   pageCount);
```

6-b) If you know the code range information, you can enter it yourself. Enter code type, section, owner, book and page number instead TicketInfo.

```
sdk.GenerateNcode(
      out codeData,
      NCODE_TYPE.N3C6,
                                    // Ncode type
      3,
                                    // section
      28,
                                    // owner
      10,
                                    // book
      1,
                                    // page
      6.0,
                                    // inch
      8.0,
                                    // inch
      pageCount);
```

## 7-a) Export as image file.

```
sdk.GetImage(codeData[i], 600, outputFilename, false);
```

### 7-b) Export as postscript file.

```
sdk.GetPostscript(codeData, outputFilename);
```

### 8. Caution

The code might not print properly if you directly print the bitmap image that was received with the return value.

In order for the smartpen to correctly recognize Ncode, you should print the pixels as they are without distorting the original. Typically, the printer dithers itself on output to make it easier to see with the naked eye. Because of this, the code is not kept as it is, and the smartpen will not recognize it.

The important thing is that you have to use the means to print Ncode as it is.

In addition, even if it can print the original as it is, the color laser printers that able to handle postscript 2 or higher are recommended. Because of the case of the inkjet printer smearing.

There are a few things you need to know to get the correct output.

### 1) Output through Adobe pdf

The Adobe reader(Acrobat reader) has the ability to print the pdf file as it is.

Therefore, if Ncode layer is added to pdf by using pdf library and then printed, Ncode can be output without distortion.

However, when printing, **Ncode must be printed in carbon black color** (corresponding to K in CMYK color of printer), and **background other than Ncode should not contain carbon black**.

This is because the NeoLAB smartpen recognizes only the carbon black color and identifies Ncode. Please take a look at the following parts to help you understand.

#### 2) CMYK and CMYKK'

When printing, four colors of CMYK or five colors of CMYKK 'can be used as the color space.

If you use CMYK, you must use K for Ncode, so if you have a background, you should represent the background color with only CMY color combinations. There is an issue that the background color must be corrected. If you only output Ncode without background, there is no problem.

Therefore, the use of CMYKK '(using non-carbon black) is a good way to get better quality. This is because Ncode can be identified using non-carbon black without modifying the background color.

You need to use a professional printing shop for using CMYKK' color space.

# 9. Generating Ncoded PDF

#### 1) Ghostscript

You can convert postscript file to Adobe PDF file using "ps2pdf.exe" If you want to convert on source code, refer below sample code.

```
Process process = new System.Diagnostics.Process();
process.StartInfo.FileName = "cmd.exe";
process.StartInfo.Arguments = "/C ps2pdf " + postscriptFilename;
process.Start();
```

#### 2) Datalogics library

#### a) The sample code has the following process:

- i) Initializing Ncode SDK class and PdfAgentLib class.
- ii) Creating Ncode image with GenerateNcode() function,
- iii) Creating Ncode PDF file by combining image and PDF file generated by RemoveK\_and\_AddNcode\_from\_Image() function.
- Caution : The first argument of Init function of PdfAgentLib, libpath, you enter when you initialize the library should not contain Unicode characters.

#### b) Development environment settings

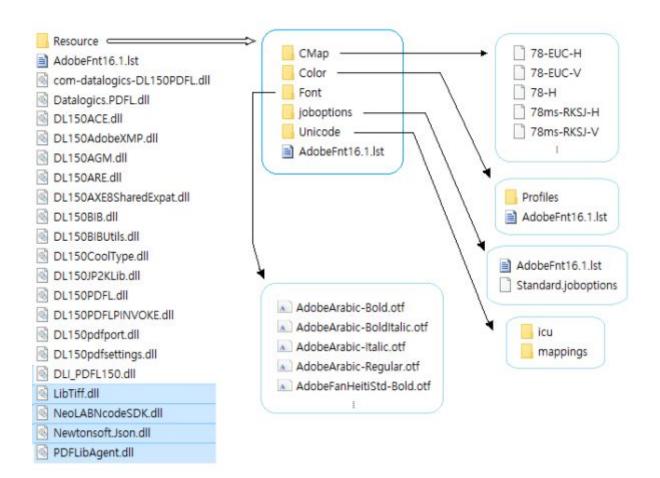

The C# PDF sample code that we provide is using the Adobe PDF Library provided by Datalogics

(http://www.datalogics.com/products/pdf/pdflibrary/).

Also, our sample project is built in 64bit environment.

#### c) Additional files list and placement

You should place the Datalogics binary files as follows. Sample is based on the location of the executable file.(Please refer to attached picture.) If you don't have it, you can purchase it or apply for a trial version to use. Files marked in blue are provided with sample code. If you are trying with trial version of Datalogics library, it needs license file "eval.lic" for initializing library.

#### d) Version exception

The following errors can occur.

PdfLibAgent.dll provided by NeoLAB is compatible with certain Datalogics versions. If it is not compatible with your version, PdfLibAgent will generate the following error.

We provide dll files for many Datalogics versions, but if you do not have the correct dll for your version, please contact us at the following URL.

(https://github.com/NeoSmartpen/Ncode-SDK2.0beta/issues)

#### e) Add reference

NeoLABNcodeSDK.dll Newtonsoft.Json.dll PDFLibAgent.dll

- 3) Adobe Acrobat pro version can convert postscript to PDF.
- 4) iTextSharp samples will be updated soon.
